Introduction
This assignment is simply practice of ideas presented in class. You must do these soon after the class and lab so you reinforce the skills and ideas in preparation for the next two classes. This homework should not take more than one hour.

The Problem
You will add a new directory to the pictures directory on your website. This directory will contain copies of the images and captions from your album1 directory, but the html page will have one image tag and several buttons. The buttons will allow a user to select which of five images to view.

The Details
Start by:

a. Make a directory called slideshow1 under the public_html/pictures
b. Under slideshow1, make directories called small, big, and captions
c. Put five big and small images and their captions (use old ones or new ones)
d. Type the slideshow1.html code from class 15 into this directory
e. Make sure everything is readable and test it from a browser

Make These Changes:

1. Add a row at the bottom of the table with five buttons
2. The five buttons say "1", "2", "3", "4" and "5" (without quotes)
3. When the user presses a button, that image and captions appear
4. When the user clicks the small image, the corresponding big image shows

Turning in Your Work

1. Make sure your page works on your website
2. Use ssh or Fugu to transfer the html page to your desktop
3. Use Moodle to submit that html page
