Selected Readings & Class Presentations

In this assignment, we will practice reading papers from the literature to cover heuristic algorithms. The goal is to learn some new concepts, and have an interactive discussion in the class.

As a presenter, you are expected to prepare a 20-minute summary of the paper, and be prepared to answer any questions from the class, who will send questions to you 24 hours earlier. You may use the board, or slides, or material borrow from the web – but make sure you document all your sources, and give credit where appropriate. You will be graded on the quality of the presentation, your preparedness, and your ability to answer relevant questions.

As active participants, send 3 thoughtful questions to the presenter, and actively participate in the discussion. You may ask your questions, if the speaker did not answer them, or you may ask new questions. You will be graded on the quality of your questions and your in-class participation.
