Write a Python program that takes attendance in class.

Suppose you have a student name list called `students`. For example,

```
>>> print students
['Alice', 'Bob', 'Chris', 'Dan', 'Ellen', 'Fran', 'Ginny', 'Hal']
```

Create a new list called `present`. Write a loop that, for each student in the list, asks the user “Is <studentname> here today?” and then reads in a string in response. If the string starts with the letter ‘y’, puts that student’s name into the list `present`. Print out the contents of `present` when you have finished taking attendance.
