Homework Assignment 3

This assignment is due by Tuesday March 1 (in class). Assignments should be handed in before the class begins.

Problem 1: Solve exercises 6.5-8, 6.5-9 (page 166), 8.2-4 (page 197), 8.33, 8.3-4 (page 200), and 9.3-1, and 9.3-3 (page 223) in the textbook.

For 8.3-3 please state a loop invariant and use it in your proof.

Problem 2: In each of the following questions you are asked to design an $O(n)$ algorithm that takes as input: an array with $n$ distinct numbers and an integer $k \leq n$ (the array is not in sorted order). Note that $k$ is not a constant and it may depend on $n$ (e.g. we may have $k = \sqrt{n}$) so an algorithm with $O(kn)$ run time does not satisfy the requirement. In each part you need to argue both the correctness and run time of the algorithm.

(i) Give an $O(n)$ algorithm that finds the $k$ smallest numbers in the array.

(ii) Give an $O(n)$ algorithm that finds the elements of rank $\lceil \frac{n}{2} \rceil - k + 1, \lceil \frac{n}{2} \rceil - k + 2, \ldots, \lceil \frac{n}{2} \rceil, \ldots, \lfloor \frac{n}{2} \rfloor + k$ in the array (so we are looking for a “band” of $2k$ elements around the median).

(iii) Give an $O(n)$ algorithm that finds the $k$ elements that are closest in value to the median. For example, if $k = 5$, $n = 11$ and the array is 1, 2, 3, 4, 5, 6, 8, 14, 15, 16, 17, then the median is 6 and the 5 closest numbers are 2, 3, 4, 5, 8. Note that the array in the example is shown in sorted order but the input array is not necessarily sorted.

Hints: You may assume a linear time algorithm for selection (as in chapter 9) but you can treat it as a black box and do not need to know or explain its details in your solution for this question. Parts (i), (ii) should be helpful for part (iii).
