

## Refresh: Complete these laws

(append ' ()                   zs) == ...

(append (cons y ys) zs) == ...

(reverse ' ())                == ...

(reverse (cons y ys)) == ...

**Refresh: Complete these laws**

**Waiting...**

## Refresh: Complete these laws

```
(append ' ()           zs) == zs
(append (cons y ys) zs) == (cons y (append ys zs))

(reverse ' ())         == ' ()
(reverse (cons y ys)) == (append (reverse ys)
                                    (list1 y))
```

# **Impcore: Things that should offend you**

**Look up function vs look up variable:**

- Different interfaces!

**To get variable, check multiple environments**

**Create a function? Must give it a name**

- High cognitive overhead
- A sign of second-class citizenship

# Scheme simplifies names

Simpler naming:

- Name stands for a **mutable location**
- Location holds values, updated with **set**
- Function is just another value

# New Evaluation Judgment

Judgment  $\langle e, \rho, \sigma \rangle \Downarrow \langle v, \sigma' \rangle$

- Mappings in  $\rho$  never change
- $\rho$  maps a name to a mutable location
- $\sigma$  is the store (contents of every location)

Intuition of the compiler writer:

- $\rho$  models the compiler's "symbol table"
- $\sigma$  models the contents of registers and memory

Classic semantic technique

# $\mu$ Scheme vs Impcore

**New abstract syntax:**

**LET (keyword, names, expressions, body)**

**LAMBDA(X (formals, body)**

**APPLY (exp, actuals)**

## Introduce local names into environment

```
(let ([x1 e1]
      ...
      [xn en])
  e)
```

Square brackets mean the same as round, but are easier to see

## What McCarthy might have done

```
(let ([val x1 e1]  
      ...  
      [val xn en])  
  e)
```

(But semantics of let, let\*, letrec is much simpler)

## Semantics of let binding

$$\frac{\begin{array}{c} \langle e_1, \rho, \sigma_0 \rangle \Downarrow \langle v_1, \sigma_1 \rangle \\ \langle e_2, \rho, \sigma_1 \rangle \Downarrow \langle v_2, \sigma_2 \rangle \\ \ell_1, \ell_2 \notin \text{dom } \sigma_2 \\ \langle e, \rho\{x_1 \mapsto \ell_1, x_2 \mapsto \ell_2\}, \sigma_2\{\ell_1 \mapsto v_1, \ell_2 \mapsto v_2\} \rangle \Downarrow \langle v, \sigma' \rangle \end{array}}{\langle \text{LET}(\langle x_1, e_1, x_2, e_2 \rangle, e), \rho, \sigma \rangle \Downarrow \langle v, \sigma' \rangle} \quad (\text{LET2})$$

# Function escapes!

```
-> (define to-the-n-minus-k (n k)
      (let
        ([x-to-the-n-minus-k (lambda (x)
                                    (- (exp x n) k))])
        x-to-the-n-minus-k))
-> (val x-cubed-minus-27 (to-the-n-minus-k 3 27))
-> (x-cubed-minus-27 2)
-19
```

## No need to name the escaping function

```
-> (define to-the-n-minus-k (n k)
      (lambda (x) (- (exp x n) k)))
-> (val x-cubed-minus-27 (to-the-n-minus-k 3 27))
-> (x-cubed-minus-27 2)
-19
```

# The zero-finder

```
(define findzero-between (f lo hi)
  ; binary search
  (if (>= (+ lo 1) hi)
      hi
      (let ([mid (/ (+ lo hi) 2)])
        (if (< (f mid) 0)
            (findzero-between f mid hi)
            (findzero-between f lo mid)))))

(define findzero (f) (findzero-between f 0 100))
```

## Cube root of 27 and square root of 16

```
-> (findzero (to-the-n-minus-k 3 27))  
3  
-> (findzero (to-the-n-minus-k 2 16))  
4
```

# Lambda questions

```
(define combine (p? q?)  
  (lambda (x) (if (p? x) (q? x) #f)))
```

```
(define divvy (p? q?)  
  (lambda (x) (if (p? x) #t (q? x))))
```

```
(val c-p-e (combine prime? even?))  
(val d-p-o (divvy prime? odd?))
```

(c-p-e 9) == ?

(d-p-o 9) == ?

(c-p-e 8) == ?

(d-p-o 8) == ?

(c-p-e 7) == ?

(d-p-o 7) == ?

# Lambda answers

```
(define combine (p? q?)  
  (lambda (x) (if (p? x) (q? x) #f)))
```

```
(define divvy (p? q?)  
  (lambda (x) (if (p? x) #t (q? x))))
```

```
(val c-p-e (combine prime? even?))  
(val d-p-o (divvy prime? odd?))
```

(c-p-e 9) == #f  
(c-p-e 8) == #f  
(c-p-e 7) == #f

(d-p-o 9) == #t  
(d-p-o 8) == #f  
(d-p-o 7) == #t

# Algebraic laws when functions escape

Laws have nested applications on left-hand side:

```
((combine p? q?) x) == (if (p? x) (q? x) #f)  
((divvy p? q?) x) == (if (p? x) #t (q? x))
```

One application for each `define` or `lambda`

Good place for syntactic sugar (short-circuit operators):

```
((combine p? q?) x) == (&& (p? x) (q? x))  
((divvy p? q?) x) == (|| (p? x) (q? x))
```

# Semantics of Lambda

**Key Issue: Values of free variables**

**Static scoping:**

Where lambda occurs, “look outward” for  $\rho$ ;  
Capture that  $\rho$  for future reference.

---

$$\langle \text{LAMBDA}(\langle x_1, \dots, x_n \rangle, e), \rho, \sigma \rangle \Downarrow \langle (\text{LAMBDA}(\langle x_1, \dots, x_n \rangle, e), \rho), \sigma \rangle$$

(MKCLOSURE)

Create closure in C implementation of eval by

```
case LAMBDA:
```

```
    return mkClosure(e->u.lambdax, env);
```

# Applying Closures (Two Arguments)

Captured environment for free variables

Arguments for bound variables ( $\equiv$  formal parameters)

$$\langle e, \rho, \sigma \rangle \Downarrow \langle \text{LAMBDA}(\langle x_1, x_2 \rangle, e_c), \rho_c \rangle, \sigma_0 \rangle$$

$$\langle e_1, \rho, \sigma_0 \rangle \Downarrow \langle v_1, \sigma_1 \rangle$$

$$\langle e_2, \rho, \sigma_1 \rangle \Downarrow \langle v_2, \sigma_2 \rangle$$

$$\ell_1, \ell_2 \notin \text{dom } \sigma_2$$

$$\underline{\langle e_c, \rho_c \{x_1 \mapsto \ell_1, x_2 \mapsto \ell_2\}, \sigma_2 \{\ell_1 \mapsto v_1, \ell_2 \mapsto v_2\} \rangle \Downarrow \langle v, \sigma' \rangle}$$

$$\langle \text{APPLY}(e, e_1, e_2), \rho, \sigma \rangle \Downarrow \langle v, \sigma' \rangle$$

(**APPLYCLOSURE2**)

```
xs = f.u.closure.lambda.formals;
return eval(f.u.closure.lambda.body,
           bindalloclist(xs, vs, f.u.closure.env));
```
