exercise with RDS files

1. Save to your machine, and use `readRDS` to read, the classexercise.rds file linked on today's date in the course schedule.

2. Extract its data into a new list. It includes, among other things, a data frame and a string with instructions on something to send privately in Piazza. Follow the instructions.

3. Extract the data frame. Use `apply` to compute the means of the two *columns* it contains, and send those to me as well.

4. Extract the word list. Use `grep` or `grepl` to compute which words contain the letter "o." Finally, send me your code and its output. (You can send them all in one msg.)
